

Data Visualisation using Matplotlib

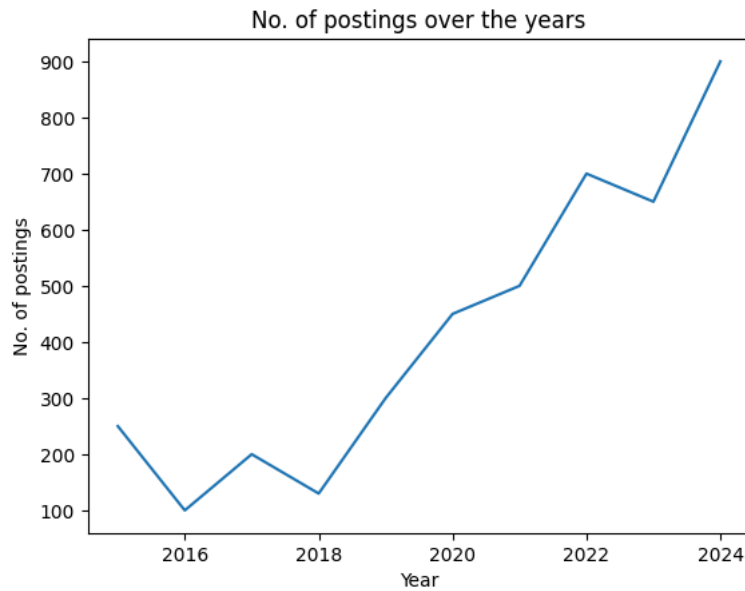

Aim

To demonstrate **data visualization using Matplotlib** by plotting the trend of the number of postings over the years.

Procedure

1. Import the necessary libraries — pandas for data handling and matplotlib.pyplot for visualization.
2. Create lists for Year and No_of_postings to represent the data.
3. Convert the lists into a pandas **DataFrame** for easier manipulation and plotting.
4. Use the plot() function from Matplotlib to draw a line graph between Year and Number of Postings.
5. Label the X-axis as “Year” and Y-axis as “No. of postings”, and set a suitable title for the plot.
6. Display the line chart using plt.show() to observe the trend visually.

```
import pandas as pd
import matplotlib.pyplot as plt
year=list(range(2015,2025))
no_postings=[250,100,200,130,300,450,500,700,650,900]
df=pd.DataFrame({'Year':year,'No_of_postings':no_postings})
plt.plot(df['Year'],df['No_of_postings'])
plt.xlabel('Year')
plt.ylabel('No. of postings')
plt.title('No. of postings over the years')
plt.show()
```

Result

Hence, a Python program to demonstrate **data visualization using Matplotlib** has been successfully implemented, showing the trend of the number of postings over the years.
