

Data Visualisation using Matplotlib

Aim

To demonstrate **data visualization using Matplotlib** by plotting the number of jobs available for different roles as a horizontal bar chart.

Procedure

1. Import the necessary libraries — pandas for data handling and matplotlib.pyplot for plotting.
2. Create a dataset containing roles and their corresponding number of jobs.
3. Convert the dataset into a pandas DataFrame for easier manipulation.
4. Use the `barh()` function from Matplotlib to create a horizontal bar chart with roles on the Y-axis and number of jobs on the X-axis.
5. Display the chart using `plt.show()` to visualize the job distribution across different roles.

```
import pandas as pd
import matplotlib.pyplot as plt
df=pd.DataFrame({"Roles":["Data Scientist","Data Analyst","Data Engineer","Machine Learning Engineer","Data Architect"],"No. Of Jobs":250,300,450,120,160})
print(df)
plt.barh(df['Roles'],df['No. Of Jobs'])
plt.show()
```

	Roles	No. Of Jobs
0	Data Scientist	250
1	Data Analyst	300
2	Data Engineer	450
3	Machine Learning Engineer	120
4	Data Architect	160

Result

Hence, a Python program to demonstrate **data visualization using Matplotlib** has been successfully implemented, showing the number of jobs available for various roles using a horizontal bar chart.
